/note="Organ: pooled; Vector: pT773D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; Equal amounts of plasmid DNA from three normalized libraries (fetal lung NbHL19W, testis NHT, and B-cell NCI_CGAP_GCB1) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-687239, 726408-728711, and 729096-731399. Subtraction by Bento Soarses and M. Fatima Bonaldo. "

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in RIKEN. Division of Experimental Animal Research in Riken contributed to prepare mouse tissues. First strand cDNA was primed with a primer [5' GAGAGAGGARCCAAAGACTCTTTTTTTTTTTTTTTTTVN 3'], CDNA was prepared by using trehalose thermo-activated reverse transcriptase and subsequently enriched for full-length by cap-trapper. cDNA went through one round of normalization to Rot = 5.0 and subtraction Rot = 25.0. Second strand cDNA was prepared with the primer adapter of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Direct Submission

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                Score

Chymosin can be produced in a plant seed through introduction of a chimeric nucleic acid molecule, comprising a nucleic acid sequence encoding a chymosin polypeptide operatively linked to transcription regulator and terminator sequences, into a plant cell. The sequences are useful for producing plant seeds, in particular seeds of soybean, rape seed, sunflower, cotton, corn, tobacco, alfalfa, wheat, barley, oats, sorghum, Arabidopsis thaliana, potato, flax/linseed, safflower, oil palm, groundnut, Brazil nut, coconut, castor, coriander, squash, jojoba and rice.

C B.napus plants.

C B.napus plants.

C B.napus plants.

C B.napus plants.

C oil-body targeting sequence, a transcription regulation sequence and the coll-body targeting sequence, a transcription regulation sequence and the protein of interest can be used to produce antibodies, proteases, proteases inhibitors, seed storage proteins, thrombin inhibitors, proteases inhibitors, seed storage composed the proteins, thrombin inhibitors, proteins, interleukins, chymosin, cystatin, cxylanase, carp growth hormone, zein or a collagenase.

C xylanase, carp growth hormone, zein or a collagenase.

C xylanase, carp growth protein or used in cassociation with the oil body fraction.

C allows production of commercially important proteins on a superior scale to production by conventional systems. The expressed heterologous protein can be easily separated from host cell components

C protein can be easily separated from host cell components

C due to the use of the oil body as a carrier protein.

This HindIII fragment was joined to a nopaline synthase terminator and cloned into binary vector pCGN1559. The resulting plasmid was called pSBSOTPTNT and introduced into A.tumefaciens. The resulting bacterial strain was used to transform

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                  Also claimed is E.coli JM83/pLC7 (ATCC 39325) which is transformed with pLC7 contg. the prorennin derived sequence fused in phase with B-galactosidase. The pLC7 prorennin expression plasmid includes sequences which code for both the pseudorennin and mature rennin cleavage sites between AAs 28-29 and AAs 42-43, respectively.

rue inventors claim the prochymosin gene comprising a nucleotide sequence from (a) the 1st codon (GCT) to the 365th codon (ATC), (b) the 5th codon (CGG) to the 365th codon (ATC); and recombinan plasmids harboured by Escherichia coli strains deposited as FENA 262, -263 and -264. Any portion of the nucleotide sequence as described in AAN40055 can be used. Also claimed is a vector deriftrom plasmid pBR322. Typically plasmid pCR501 is obtd. from pOCT

GAL1 promoter linked to gene - useful for direction of expression of the gene in yeast of the recombinant material carrying a GAL1 promoter of the yeast galactokinase gene may be used in expressing a desired protein, bovine growth hormone, interferon, prorennin or preprorennin, it yeast cell. Strains of Saccharomyces cerevisiae producing the polypeptides are produced. Yeast strains deposited as ATCC 2064: 20661, 20662 and 20663, strain designations CGY 196, 457, 461 are produced.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The DNA encoding prochymosin can be cloned into a plasmid (esp. from S. cremoris SK112) and used to produce large amts of the protein by recombinant DNA techniques. This could overcome shortages of prochymosin due to a shortage of calf stomachs and increasing cheese prodn. Prochymosin is also used in prodn. of yoghurt, butter and buttermilk.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                 The prorennin (prochymosin) sequence was deduced from the DNA sequence obtd. by screening a cDNA library with rennin specific probes derived from the published amino acid sequence of rennin (Foltmann et al., J. Biol. Chem. 254, 8447-8456 (1979)) (see 232291,2). The deduced protein sequence was the same as the published sequence after cleavage of the signal peptide, except for an amino acid change at residue 218, which may be an artefact of protein sequencing in the original sequence. The cleavage product of protein sequencing in the original sequence. The cleavage product of protein B. The cleaved synthesised in two active forms rennin A, and rennin B. The cleaved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                28-OCT-1988;

The Kluyveromyces expression systems provide highly efficient secretion and processing of a wide variety of proteins. Sequences identical to those published in EP301669.
